West Central Avenue Plume, Albuquerque, NM - Removal Assessment-

Information: During the week of April 11, EPA assessed the West Central Avenue Plume site for the presence of vapor in structures over a trichloroethene groundwater plume associated with the Bell Trading Post building, a historic jewelry manufacturing. The vapor plume appears to go under two residential duplex buildings. EPA is also evaluating the need to conduct interior air sampling at a later date and whether to preemptively evaluate and potentially install vapor mitigation systems for buildings in close proximity to the plume.
